# Description

EMCluster provides EM algorithms and several efficient initialization methods for model-based clustering of finite mixture Gaussian distribution with unstructured dispersion in both of unsupervised and semi-supervised clustering.

#### **Details**

Package: EMCluster Type: Package License: GPL LazyLoad: yes

The install command is simply as

> R CMD INSTALL EMCluster\_0.2-0.tar.gz

from a command mode or

R> install.packages("EMCluster")

inside an R session.

Assign Class 3

#### Author(s)

Wei-Chen Chen <wccsnow@gmail.com> and Ranjan Maitra.

```

## **Examples**

```
## Not run:
demo(allinit, 'EMCluster', ask = F, echo = F)
demo(allinit_ss, 'EMCluster', ask = F, echo = F)
## End(Not run)
```

Assign Class

Assign Class Id

## Description

This function assigns cluster id to each observation in x according to the desired model emobj or specified parameters pi, Mu, and LTSigma.

## Usage

## **Arguments**

X	the data matrix, dimension $n \times p$ .
emobj	the desired model which is a list mainly contains pi, Mu, and LTSigma, usually a returned object from init.EM.
pi	the mixing proportion, length $K$ .
Mu	the centers of clusters, dimension $K \times p$ .
LTSigma	the lower triangular matrices of dispersion, dimension $K \times p(p+1)/2$ .
lab	labeled data for semi-supervised clustering, length $n$ .
return.all	if returning with a whole emobj object.

4 Conversion

#### **Details**

This function are based either an input emobj or inputs pi, Mu, and LTSigma to assign class id to each observation of x.

If lab is submitted, then the observation with label id greater 0 will not be assigned new class.

## Value

This function returns a list containing mainly two new variables: nc (length K numbers of observations in each class) and class (length n class id).

#### Author(s)

Wei-Chen Chen <wccsnow@gmail.com> and Ranjan Maitra.

#### References

```

#### See Also

```
init.EM, emcluster.
```

## **Examples**

```
## Not run:
library(EMCluster, quietly = TRUE)
set.seed(1234)
x2 <- da2$da

ret <- init.EM(x2, nclass = 2)
ret.new <- assign.class(x2, ret, return.all = FALSE)
str(ret.new)
## End(Not run)</pre>
```

Conversion

Convert Matrices in Different Format

## Description

These utility functions are to convert matrices in different formats.

#### Usage

```
LTSigma2variance(x)
variance2LTSigma(x)
LTsigma2var(x1, p = NULL)
var2LTsigma(x1)
class2Gamma(class)
Gamma2class(Gamma)
```

Conversion 5

#### **Arguments**

X	a matrix/array to be converted, the dimension could be $K \times p(p+1)/2$ or $p \times p \times K$ .
x1	a vector/matrix to be converted, the length and dimension could be $p(p+1)/2$ and $p\times p$ .
p	dimension of matrix.
class	id of clusters for each observation, length $n$ .
Gamma	containing posterior probabilities if normalized, otherwise containing component densities weighted by mixing proportion, dimension $n\times K$ .

#### **Details**

 $\verb|LTSigma2variance| converts LTSigma| format to 3D array, and variance 2LTSigma| is the inversion function.$ 

LTsigma2var converts LTsigma format to a matrix, and var2LTsigma is the inversion function. Note that LTsigma is one component of LTSigma.

class2Gamma converts id to a Gamma matrix where with probability 1 for the cluster where the observation belongs to, and Gamma2class converts posterior to cluster id where largest posterior is picked for each observation.

#### Value

A vector/matrix/array is returned.

## Author(s)

Wei-Chen Chen <wccsnow@gmail.com> and Ranjan Maitra

#### References

```

```

```
## Not run:
library(EMCluster, quietly = TRUE)
x <- da2$LTSigma
class <- da2$class

y <- LTSigma2variance(x)
str(y)
y <- variance2LTSigma(y)
str(y)
sum(x != y)</pre>
```

6 Dataset

```
Gamma <- class2Gamma(class)
class.new <- Gamma2class(Gamma)
sum(class != class.new)
## End(Not run)</pre>
```

Dataset

Dataset for demonstrations

## **Description**

There are four small datasets to test and demonstrate EMCluster.

## Usage

da1

da2

da3

myiris

#### **Format**

da1, da2, da3 are in list, and myiris is in matrix.

## **Details**

da1 has 500 observations in two dimensions da1\$da\$x and da1\$da\$y, and they are in 10 clusters given in da1\$class.

da2 has 2,500 observations in two dimensions, too. The true parameters are given in da1\$pi, da1\$Mu, and da1\$LTSigma. There are 40 clusters given in da1\$class for this dataset.

da3 is similar to da2, but with lower overlaps between clusters.

myiris is selected from the original Iris dataset given by R.

EM Algorithm 7

EM Algorithm	EM Algorithm for model-based clustering

#### **Description**

These are core functions of **EMCluster** performing EM algorithm for model-based clustering of finite mixture multivariate Gaussian distribution with unstructured dispersion.

## Usage

# Arguments

guments				
X	the data matrix, dimension $n \times p$ .			
emobj	the desired model which is a list mainly contains pi, Mu, and LTSigma, usually a returned object from init.EM.			
pi	the mixing proportion, length $K$ .			
Mu	the centers of clusters, dimension $K \times p$ .			
LTSigma	the lower triangular matrices of dispersion, $K \times p(p+1)/2$ .			
lab	labeled data for semi-supervised clustering, length $n$ .			
EMC	the control for the EM iterations.			
assign.class	if assigning class id.			
maxiter	maximum number of iterations.			
eps	convergent tolerance.			
nclass	the desired number of clusters, $K$ .			

## **Details**

The emcluster mainly performs EM iterations starting from the given parameters emobj without other initializations.

The shortemcluster performs short-EM iterations as described in init.EM.

#### Value

The emcluster returns an object emobj with class emret which can be used in post-process or other functions such as e.step, m.step, assign.class, em.ic, and dmixmvn.

The shortemcluster also returns an object emobj with class emret which is the best of several random initializations.

The simple.init utilizes rand.EM to obtain a simple initial.

8 EM Control

#### Author(s)

Wei-Chen Chen <wccsnow@gmail.com> and Ranjan Maitra.

```

#### **Examples**

```
## Not run:
library(EMCluster, quietly = TRUE)
set.seed(1234)
x1 <- da1$da
emobj <- simple.init(x1, nclass = 10)
emobj <- shortemcluster(x1, emobj)
summary(emobj)
ret <- emcluster(x1, emobj, assign.class = TRUE)
summary(ret)
## End(Not run)</pre>
```

EM Control

EM Control Generator and Controller

## **Description**

The .EMControl generates an EM control (.EMC) controlling the options and conditions of EM algorithms, i.e. this function generate a default template. One can either modify .EMC or employ this function to control EM algorithms. By default, .EMC, .EMC.Rnd, and .EC.Rndp are three native controllers as the **EMCluster** is loaded.

# Usage

```
.EMControl(alpha = 0.99, short.iter = 200, short.eps = 1e-2,
    fixed.iter = 1, n.candidate = 3,
    EM.iter = 1000, EM.eps = 1e-6, exhaust.iter = 5)
.EMC
.EMC.Rnd
.EMC.Rnd
```

EM Control 9

## **Arguments**

```
only used in emgroup for "SVD" initialization.
alpha
short.iter
                  number of short-EM steps, default = 200.
short.eps
                  tolerance of short-EM steps, default = 1e-2.
                  fixed iterations of EM for "RndEM" initialization, default = 1.
fixed.iter
n.candidate
                  reserved for other initialization methods (unimplemented).
EM.iter
                  maximum number of long-EM steps, default = 1000.
EM.eps
                  tolerance of long-EM steps, default = 1e-6.
                  number of iterations for "exhaustEM" initialization, default = 5.
exhaust.iter
```

#### **Details**

exhaust.iter and fixed.iter are used to control the iterations of initialization procedures.

short.iter and short.eps are used to control the short-EM iterations.

EM. iter and EM. eps are used to control the long-EM iterations.

Moeover, short.eps and EM.eps are for checking convergence of the iterations.

#### Value

This function returns a list as . EMC by default.

The .EMC.Rnd is equal to .EMControl(short.eps = Inf) and usually used by the rand.EM method.

The .EMC.Rndp is equal to .EMControl(fixed.iter = 5) where each random initials run 5 EM iterations in the rand.EM method.

```
## Not run:
library(EMCluster, quietly = TRUE)

.EMC <- .EMControl()
.EMC.Rnd <- .EMControl(short.eps = Inf)
.EMC.Rndp <- .EMControl(fixed.iter = 5)
## End(Not run)</pre>
```

10 Information Criteria

Information Criteria Information Criteria for Model-Based Clustering

### **Description**

These functions are tools for compute information criteria for the fitted models.

## Usage

## **Arguments**

X	the data matrix, dimension $n \times p$ .
emobj	the desired model which is a list mainly contains $pi$ , Mu, and LTSigma, usually a returned object from $init.EM$ .
pi	the mixing proportion, length $K$ .
Mu	the centers of clusters, dimension $K \times p$ .
LTSigma	the lower triangular matrices of dispersion, $K \times p(p+1)/2$ .
llhdval	the total log likelihood value of x given emobj.

#### **Details**

The em.ic calls all other functions to compute AIC (em.aic), BIC (em.bic), CLC (em.clc), ICL (em.icl), and ICL.BIC (em.icl.bic). All are useful information criteria for model selections, mainly choosing number of cluster.

#### Value

em.ic returns a list containing all other information criteria for given the data x and the desired model emobj.

#### Author(s)

Wei-Chen Chen <wccsnow@gmail.com> and Ranjan Maitra

```
http://maitra.public.iastate.edu/
```

Initialization and EM 11

## See Also

```

```

### **Examples**

```
## Not run:
library(EMCluster, quietly = TRUE)
x2 <- da2$da
emobj <- list(pi = da2$pi, Mu = da2$Mu, LTSigma = da2$LTSigma)
em.ic(x2, emobj = emobj)
## End(Not run)</pre>
```

Initialization and EM Initialization and EM Algorithm

## **Description**

These functions perform initializations (including em.EM and RndEM) followed by the EM iterations for model-based clustering of finite mixture multivariate Gaussian distribution with unstructured dispersion in both of unsupervised and semi-supervised clusterings.

#### Usage

## Arguments

```
x the data matrix, dimension n \times p.

nclass the desired number of clusters, K.

lab labeled data for semi-supervised clustering, length n.

EMC the control for the EM iterations.

stable.solution if returning a stable solution.

min.n restriction for a stable solution, the minimum number of observations for every final clusters.
```

12 Initialization and EM

min.n.iter restriction for a stable solution, the minimum number of iterations for trying a

stable solution.

method an initialization method.

#### **Details**

The init.EM calls either em.EM if method="em.EM" or rand.EM if method="Rnd.EM".

The em.EM has two steps: short-EM has loose convergent tolerance controlled by .EMC\$short.eps and try several random initializations controlled by .EMC\$short.iter, while long-EM starts from the best short-EM result (in terms of log likelihood) and run to convergence with a tight tolerance controlled by .EMC\$EM.eps.

The rand.EM also has two steps: first randomly pick several random initializations controlled by .EMC\$short.iter, and second starts from the best of the random result (in terms of log likelihood) and run to convergence.

The lab is only for the semi-supervised clustering, and it contains pre-labeled indices between 1 and K for labeled observations. Observations with index 0 is non-labeled and has to be clustered by the EM algorithm. Indices will be assigned by the results of the EM algorithm. See demo(allinit\_ss,'EMCluster') for details.

The exhaust.EM also calls the init.EM with different EMC and perform exhaust.iter times of EM algorithm with different initials. The best result is returned.

#### Value

These functions return an object emobj with class emret which can be used in post-process or other functions such as e.step, m.step, assign.class, em.ic, and dmixmvn.

plotem(ret.Rnd, x)
plotem(ret.init, x)
## End(Not run)</pre>
```

Jaccard Index

Jaccard Index

## Description

This function returns the Jaccard index for binary ids.

## Usage

```
Jaccard.Index(x, y)
```

## **Arguments**

```
x true binary ids, 0 or 1.
```

y predicted binary ids, 0 or 1.

#### **Details**

All ids, x and y, should be either 0 (not active) or 1 (active). Any value other than 1 will be converted to 0.

#### Value

Return the value of Jaccard index.

```

14 Likelihood Mixture Tests

## **Examples**

```
## Not run:
library(EMCluster, quietly = TRUE)

x.id <- c(1, 1, 1, 0, 0, 0, 3, 3, 3)
y.id <- c(0, 1, 0, 1, 1, 1, 0, 1, 1)

Jaccard.Index(x.id, y.id)

## End(Not run)</pre>
```

Likelihood Mixture Tests

Likelihood Mixture Tests

## **Description**

This function test two mixture Gaussian models with unstructured covariance matrix and different numbers of clusters.

## Usage

## Arguments

emobj.0 a emret object for the null hypothesis.

x the data matrix, dimension  $n \times p$ .

tau proportion of null and alternative hypotheses.

n.mc.E.delta number of Monte Carlo simulations for expectation of delta (difference of logL).

n.mc.E.chi2 number of Monte Carlo simulations for expectation of chisquare statistics.

verbose if verbose.

#### **Details**

This function calls several subroutines to compute information, likelihood ratio statistics, degrees of freedom, non-centrality of chi-squared distributions ...etc. Based on Monte Carlo methods to estimate parameters of likelihood mixture tests, this function return a p-value for testing H0: emobj.0 v.s. Ha: emobj.a.

#### Value

A list of class 1mt are returned.

(lmt.24 <- lmt(ret.2, ret.4, x))
## End(Not run)</pre>
```

LMT Functions

Likelihood Mixture Test (LMT) Functions of EMCluster

## **Description**

All likelihood mixture test (LMT) functions are for testing and can be utilized by advanced developers with caution.

Currently, these are only for workflows.

#### Author(s)

Wei-Chen Chen <wccsnow@gmail.com> and Ranjan Maitra.

```
http://maitra.public.iastate.edu/
```

16 MVN

MVN

Density of (Mixture) Multivariate Normal Distribution

#### **Description**

These functions are tools for compute density of (mixture) multivariate Gaussian distribution with unstructured dispersion.

## Usage

```
dmvn(x, mu, LTsigma, log = FALSE)
dlmvn(x, mu, LTsigma, log = TRUE)
dmixmvn(x, emobj = NULL, pi = NULL, Mu = NULL, LTSigma = NULL, log = FALSE)
logL(x, emobj = NULL, pi = NULL, Mu = NULL, LTSigma = NULL)
```

#### **Arguments**

X	the data matrix, dimension $n \times p$ .
mu	the centers of clusters, length $p$ .
LTsigma	the lower triangular matrices of dispersion, length $p(p+1)/2$ .
log	if logarithm returned.
emobj	the desired model which is a list mainly contains pi, Mu, and LTSigma, usually a returned object from init.EM.
pi	the mixing proportion, length $K$ .
Mu	the centers of clusters, dimension $K \times p$ .
LTSigma	the lower triangular matrices of dispersion, $K \times p(p+1)/2$ .

#### **Details**

The dmvn and dlmvn compute density and log density of multivariate distribution.

The dmixmvn computes density of mixture multivariate distribution and is based either an input emobj or inputs pi, Mu, and LTSigma to assign class id to each observation of x.

The logL returns the value of the observed log likelihood function of the parameters at the current values of the parameters pi, Mu, and LTSigma, with the suplied data matrix x.

#### Value

A density value is returned.

## Author(s)

Wei-Chen Chen <wccsnow@gmail.com> and Ranjan Maitra.

```
http://maitra.public.iastate.edu/
```

Other Initializations 17

#### See Also

```
init.EM, emcluster.
```

## **Examples**

```
## Not run:
library(EMCluster, quietly = TRUE)
x2 <- da2$da
x3 <- da3$da

emobj2 <- list(pi = da2$pi, Mu = da2$Mu, LTSigma = da2$LTSigma)
emobj3 <- list(pi = da3$pi, Mu = da3$Mu, LTSigma = da3$LTSigma)

logL(x2, emobj = emobj2)
logL(x3, emobj = emobj3)

dmixmvn2 <- dmixmvn(x2, emobj2)
dmixmvn3 <- dmixmvn(x3, emobj3)

dlmvn(da2$da[1,], da2$Mu[1,], da2$LTSigma[1,])
log(dmvn(da2$da[1,], da2$Mu[1,], da2$LTSigma[1,]))

## End(Not run)</pre>
```

Other Initializations Other Initializations

## **Description**

Two more functions with different initialization method.

## Usage

```
starts.via.svd(x, nclass = 1, method = c("em", "kmeans"),

EMC = .EMC)

emgroup(x, nclass = 1, EMC = .EMC)
```

## Arguments

```
x the data matrix, dimension n \times p.

nclass the desired number of clusters, K.

method method with the svd initializations.

EMC the control for the EM iterations.
```

#### **Details**

The starts.via.svd utilizes SVD to initial parameters, and the emgroup runs the EM algorithm starting from the initial.

18 Plot EM Results

## Value

The starts.via.svd returns an object with class svd, and the emgroup returns and object emobj with class emret.

#### Author(s)

Wei-Chen Chen <wccsnow@gmail.com> and Ranjan Maitra.

#### References

ret.0 <- starts.via.svd(x1, nclass = 10, method = "kmeans")
summary(ret.0)
## End(Not run)</pre>
```

Plot EM Results

Plot Two Dimensional Data with clusters

## **Description**

The functions plot two dimensional data for clusters.

## Usage

Plot EM Results

## **Arguments**

emobj	the desired model which is a list mainly contains $pi$ , Mu, and LTSigma, usually a returned object from $init.EM$ .
х	the data matrix, dimension $n \times p$ .
main	title of plot.
xlab	label of x-axis.
ylab	label of y-axis.
	other parameters to the plot.
k	index for symbols.
color.pch	color and style for symbols.
append.BN	if appending bivariate normal ellipsoid.

#### **Details**

This a simple x-y lot.

## Value

A plot is returned.

## Author(s)

Wei-Chen Chen <wccsnow@gmail.com> and Ranjan Maitra.

20 Plot Multivariate Data

```
Plot Multivariate Data
```

Plot Multivariate Data

# Description

The function plots multivariate data for clusters as the parallel coordinates plot.

## Usage

```
plotmd(x, class = NULL, xlab = "Variables", ylab = "Data", ...)
```

# Arguments

x	the data matrix, dimension $n \times p$ .
class	class id for all observations.
xlab	label of x-axis.
ylab	label of y-axis.
	other parameters to the plot.

## **Details**

This a simplified parallel coordinate plot.

## Value

A plot is returned.

## Author(s)

Wei-Chen Chen <wccsnow@gmail.com> and Ranjan Maitra.

## References

```
http://maitra.public.iastate.edu/
```

## See Also

```
init.EM, emcluster.
```

#### **Examples**

```
## Not run:
library(EMCluster, quietly = TRUE)
set.seed(1234)

x <- myiris
ret <- em.EM(x, nclass = 5)
plotmd(x, ret$class)

## End(Not run)</pre>
```

Plot Projection and Contour

Plot Contour

## Description

The function plots multivariate data on 2D plane with contour. Typically, the contour is built via projection pursuit or SVD algorithms, such as project.on.2d().

## Usage

```
plotppcontour(da, Pi, Mu, S, class, class.true = NULL, n.grid = 128,
    angle = 0, xlab = "", ylab = "", main = "")
```

## **Arguments**

da	a projected data matrix, dimension $n \times 2$ .
Pi	proportion, length $K$ .
Mu	the projected centers of cluster, dimension $K \times 2$ .
S	projected matrices of dispersion, dimension $p \times p \times K$ .
class	id of classifications, length $n$ .
class.true	ture id of classifications if available, length $n$ .
n.grid	number of grid points.
angle	a rotation angle (0 to $2\pi$ ).
xlab	an option for plot() function.
ylab	an option for plot() function.
main	an option for plot() function.

## **Details**

This function plots projection output of project.on.2d().

da, Mu, and S are projected by some projection matrices obtained via SVD or projection pursuit algorithms. The projection is made on a 2D plane in the direction in which clusters of data x are most distinguishable to visualize.

#### Value

A 2D projection plot is returned.

#### Note

Only distinguishable for up to 7 clusters due to the limited color schemes.

## Author(s)

Wei-Chen Chen <wccsnow@gmail.com> and Ranjan Maitra.

Print and Summary

Functions for Printing or Summarizing Objects According to Classes

## Description

Several classes are declared in **EMCluster**, and these are functions to print and summary objects.

## Usage

```
## S3 method for class 'emret'
print(x, digits = max(4, getOption("digits") - 3), ...)
## S3 method for class 'emret'
summary(object, ...)
## S3 method for class 'svd'
summary(object, ...)
```

## Arguments

```
x an object with the class attributes.
digits for printing out numbers.
object an object with the class attributes.
other possible options.
```

#### **Details**

These are useful functions for summarizing and debugging.

## Value

The results will cat or print on the STDOUT by default.

## Author(s)

Wei-Chen Chen <wccsnow@gmail.com> and Ranjan Maitra.

```
http://maitra.public.iastate.edu/
```

Projection On 2D

#### See Also

```
init.EM, emcluster, starts.via.svd.
```

#### **Examples**

```
## Not run:
library(EMCluster, quietly = TRUE)
x2 <- da2$da

emobj <- list(pi = da2$pi, Mu = da2$Mu, LTSigma = da2$LTSigma)
eobj <- e.step(x2, emobj = emobj)
emobj <- m.step(x2, emobj = eobj)
summary(emobj)

ret <- starts.via.svd(x2, nclass = 10, method = "kmeans")
summary(ret)

## End(Not run)</pre>
```

Projection On 2D

Produce Projection on 2D

## **Description**

The function projects multivariate data on 2D plane which can be displayed by plotppcontour() later.

## Usage

## **Arguments**

X	the data matrix, dimension $n \times p$ .
emobj	the desired model which is a list mainly contains $pi$ , Mu, and LTSigma, usually a returned object from $init.EM$ .
pi	the mixing proportion, length $K$ .
Mu	the centers of clusters, dimension $K \times p$ .
LTSigma	the lower triangular matrices of dispersion, $K \times p(p+1)/2$ .
class	id of classifications, length $n$ .
method	either projection pursuit or singular value decomposition.

## **Details**

This function produces projection outputs of x and emobj.

Projection On 2D 25

## Value

A projection is returned which is a list contains

- da is a  $n \times 2$  projected matrix of x.
- Pi is the original proportion emobjpi of length K.
- Mu is a  $K \times 2$  projected matrix of emboj\$Mu.
- S is a  $2 \times 2 \times K$  projected array of emboj\$LTSigma.
- class is the original class id emobj\$class.
- proj.mat is the projection matrix of dimension p.

Rand Index and Adjusted Rand Index

## Description

This function returns the Rand index and the adjusted Rand index for given true class ids and predicted class ids.

#### Usage

```
RRand(trcl, prcl, lab = NULL)
```

## **Arguments**

trcl true class ids.
prcl predicted class ids.

lab known ids for semi-supervised clustering.

#### **Details**

All ids, trcl and prcl, should be positive integers and started from 1 to K, and the maximums are allowed to be different.

lab used in semi-supervised clustering contains the labels which are known before clustering. It should be positive integer and started from 1 for labeled data and 0 for unlabeled data.

## Value

Return a Class RRand contains Rand index and adjusted Rand index.

## Author(s)

Wei-Chen Chen <wccsnow@gmail.com> and Ranjan Maitra.

#### References

```
http://maitra.public.iastate.edu/
```

```
## Not run:
library(EMCluster, quietly = TRUE)

true.id <- c(1, 1, 1, 2, 2, 2, 2, 3, 3, 3)
pred.id <- c(2, 1, 2, 1, 1, 1, 2, 1, 1)
label <- c(0, 0, 0, 0, 1, 0, 2, 0, 0)

RRand(true.id, pred.id)
RRand(true.id, pred.id, lab = label)</pre>
```

Recolor Classification IDs 27

```
## End(Not run)
```

```
Recolor Classification IDs
```

Recolor Classification IDs

## **Description**

This function returns new classification IDs.

#### Usage

```
recolor(id.class, id.target)
```

#### **Arguments**

```
id.class original class ids.id.target target class ids.
```

#### **Details**

This function colors id.target in accordance with the most likely candidate in id.class.

All ids should be positive integers and started from 1 to K, and the maximums are allowed to be different.

#### Value

Return a list contains two factors, id.trcl and id.prcl, which are factor versions of id.class and id.target.

## Author(s)

Ranjan Maitra.

#### References

```

```
## Not run:
library(EMCluster, quietly = TRUE)

true.id <- c(1, 1, 1, 2, 2, 2, 3, 3, 3)
pred.id <- c(2, 1, 2, 1, 1, 1, 2, 1, 1)

recolor(pred.id, true.id)

## End(Not run)</pre>
```

Single Step

Single Step	Single E- and M-step	

## **Description**

These functions are single E- and M-step of EM algorithm for model-based clustering of finite mixture multivariate Gaussian distribution with unstructured dispersion.

## Usage

## **Arguments**

`		
	X	the data matrix, dimension $n \times p$ .
	emobj	the desired model which is a list mainly contains $pi$ , Mu, and LTSigma, usually a returned object from $init.EM$ .
	pi	the mixing proportion, length $K$ .
	Mu	the centers of clusters, dimension $K \times p$ .
	LTSigma	the lower triangular matrices of dispersion, $K \times p(p+1)/2$ .
	norm	if returning normalized Gamma.
	Gamma	containing posterior probabilities if normalized, otherwise containing component densities weighted by mixing proportion, dimension $n\times K$ .
	assign.class	if assigning class id.

#### **Details**

These two functions are mainly used in debugging for development and post process after model fitting.

## Value

The e.step returns a list contains Gamma, the posterior probabilities if norm=TRUE, otherwise it contains component densities. This is one E-step and Gamma is used to update emobj in the M-step next.

The m. step returns a new emobj according to the Gamma from the E-step above.
